| PROJECT TITLE | Plugging into the future: An exploration wise consumption pattern |
| MAX MARKS | 1 MARK |

## 5.4 – Team Management Tool for Agile Planning (Jira)

Here is the standard, traditional layout for the Agile Sprint Delivery Plan formatted as a structured project management framework. This layout uses conventional metrics, clear ownership roles, and traditional sprint tracking parameters.

Sprint Delivery Overview

| Sprint ID | Objective | Duration | Est. Story Points | Primary Owner |
|---|---|---|---|---|
| Sprint 1 | Data & Infrastructure Foundations | 2 Weeks | 34 | Data & Infrastructure Team |
| Sprint 2 | Core Logic & Algorithm Development | 2 Weeks | 40 | Backend & Data Science Team |
| Sprint 3 | Automation Scripts & User Interface | 2 Weeks | 48 | Frontend & Firmware Team |
| Sprint 4 | Pilot Deployment & Optimization | 2 Weeks | 26 | QA & DevOps Team |

---

⏱ Detailed Sprint Backlog

Sprint 1: Data & Infrastructure Foundations (Weeks 1–2)

- Sprint Goal: Establish reliable data pipelines and map the consumer energy environment.
- Target Backlog Items:
  - STORY-101: Configure IoT smart plug networks and central gateway hardware hooks. (8 pts)
  - STORY-102: Connect third-party APIs to fetch dynamic grid pricing structures. (5 pts)
  - STORY-103: Establish the core database schema to handle granular per-minute kW/kWh inputs. (13 pts)
  - STORY-104: Integrate localized weather and solar forecast data feeds. (8 pts)
- Definition of Done (Diodone): Real-time power baselines are successfully ingesting into the cloud database with zero dropped packets over a 48-hour testing window.

Sprint 2: Core Logic & Algorithm Development (Weeks 3–4)

- Sprint Goal: Build the predictive decision-making rules for peak shaving and load shifting.
- Target Backlog Items:
  - STORY-201: Code the predictive scheduling algorithm for high-load appliances. (13 pts)
  - STORY-202: Establish safety and state-of-charge (SoC) thresholds for V2H battery integration. (8 pts)
  - STORY-203: Develop automated "vampire load" detection triggers for standby equipment. (11 pts)
  - STORY-204: Run offline simulations using historical grid data to validate shifting logic. (8 pts)
- Definition of Done (Diodone): Backend decision engine correctly generates optimal usage schedules based on dynamic price inputs with an algorithmic accuracy above 92% in simulations.
