

CHAPTER – II

IDEATION PHASE

2.1 – Purpose of the Project

The purpose of the project “Plugging into the Future: An Exploration of Electricity Consumption Patterns” is to analyse and visualize electricity usage patterns to better understand how energy is consumed across different periods, regions, and sectors.

This project aims to transform raw electricity consumption data into meaningful insights using interactive dashboards and storytelling techniques. By identifying trends, peak demand periods, and consumption behaviour, the project supports better decision-making and promotes efficient energy management.

The project also focuses on forecasting future electricity demand and highlighting the importance of sustainable energy usage. Through data visualization tools and analytical methods, users can explore consumption patterns in an engaging and informative manner.

The key objectives of the project include:

- Analyse historical electricity consumption data.
- Identify usage trends and seasonal variations.
- Visualize insights through interactive dashboards.
- Support data-driven energy planning and decision-making.
- Explore future electricity demand and consumption forecasting.
- Increase awareness of efficient and sustainable energy utilization.

Overall, this project provides an analytical platform that helps users understand electricity consumption behaviour and encourages smarter energy practices for the future.
